The invention relates to a single exon nucleic acid probe (SENP) (1) for measuring human gene expression in a sample derived from human adult liver. comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (1) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhobosis, hyperlipideamia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence but was obtained in electronic format directly from WIPO at from but was obtained in electronic format directly from WIPO at

Sequences ABB10981-ABB12330 represent 1150 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of identifying compounds which atthodies against the polypeptides, methods of identifying compounds which corporateds in a sample, and methods of identifying compounds which colypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation or cell differantiation activities; stem cell growth factor activity; have various activity; activity tissue growth activity; including cytokine, cell proliferation or cell differantiation activities; stem cell growth factor activity; including cytokine, cell proliferation or cell confidence activities; neemostatic, thrombootic or thrombootic or chemokinetic activities; hemomestatic, thrombootic or thrombootic activities; activities; nemostatic or may be confidence or chemokinetic activities; pagenetation or metastasis.

Conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions include cancers, haemotopoletic disorders (e.g., metaporal or arthritis), conditions, e.g., by protein or gene therapy. Such conditions in activities and nucleoid or lymphoid cell disorders), chromic inflammatory conditions (e.g., asthma or arthritis), proliferative retinopathy, atherosclerosis, coronary heart disease, arterial isohemula, bone disorders (e.g., metaporals), while promote wound repair for nucleic acids encoding them) may be used to promote wound certain and fungal infections and ulcers), hampione coll collections and bacterial and fungal infections in addition to immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 20; Page 238; 1963pp; English.

           manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a novel human polypeptide of the invention

protein. The GGREGs are used for treating or preventing disorders associated with decreased expression of functional GGREC, and for identifying specific agonists and antagonists, also binding agents and outlators. They can also be used for generating specific antibodies and for proteosome analysis. Disorders that can be treated include cell proliferative disorders, e.g., arteriosclerosis and cancer, neurological disorders, e.g., atherosclerosis and congestive heart if alsorders, e.g., atherosclerosis and congestive heart autoimmune/inflammatory disorders, e.g., acquired immunodificiency syndrome (AIDS) and anaemia, metabolic disorders, e.g., diabetes and obesity and viral infections. Nucleic acids that encode GGREC are used to identifying agents that alter its expression, for assessing toxicity of test compounds, and as sources of primers and probes for diagnostic detection of GGREC DAY and characters and probes for diagnostic detection of GGREC DAY and the specific and release and characters.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
              New human G-protein coupled receptors, useful for treatment and diagnosis of e.g. cell proliferation, also screening for specific modulators, and related nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                               sequences. They can also be used in gene therapy, for chromosomal mapping, and for recombinant production of GCREC. The antibodies are useful for diagnosis and monitoring of diseases associated with GCREC expression, for detecting and purifying GCREC, and as therapeutic agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, olfactory receptor; OR; primary scent determination; secondary scent determination; polypeptide library; odour receptor; scent profile; scent fingerprint; scent representation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Yanai I;

New polynucleotides which encode polypeptides involved in olfactory

N-PSDB; AAD19581

```
The present sequence is a polypeptide encoded by one of 344 newly mined human genes. It was used as a query sequence in a database search of olfactory receptor (OR)-like sequences. The invention relates to isolated polymucleotides encoding polypeptides involved in olfactory sensation. The polymucleotides can be used in screening for olfactory agonists and anteapolists. The methods allow for the determination of primary scents and the identification of the odour receptors used to detect these primary scents. The methods also enable determination of secondary scents and the identification of combinations of odour receptors that are construction of a scent representation (also called a scent fingerprint or scent profile), which may be used to re-create and edit scents. Clibraries of olfactory receptors are useful for determining the interaction pattern of a composition with the receptors, and can be used for determining differences in the olfactory faculties of different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; olfactory receptor; OR; primary scent determination; secondary scent determination; polypeptide library; odour receptor; scent profile; scent fingerprint; scent representation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polynucleotides which encode polypeptides involved in olfactory sensation for identifying olfactory agonists and antagonists.
sensation for identifying olfactory agonists and antagonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 25; DB 4; Length 117; 100.0%; Pred. The present sequence is an olfactory receptor which is encoded by one of a number of novel polynucleotides. The polynucleotides can be used in screening for olfactory agonists and antagonists. The methods allow for the determination of primary scents and the identification of the odour

Claim 11; Page 934-935; 1857pp; English.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed in diagnostics as expressed sequence tags for identifying expressed control of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging constructions in the expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations
                                                                                                                                                                                                                                                                            ö
receptors used to detect these primary scents. The methods also enable determination of secondary scents and the identification of combinations of odour receptors that are involved in detecting such secondary scents. This enables the construction of a scent representation (also called a scent fingerprint or scent profile), which may be used to re-create and edit scents. Libraries of olfactory receptors are useful for determining the interaction pattern of a composition with the receptors, and can be used for determining differences in the olfactory faculties of different individuals
                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; chromosome mapping; gene mapping; gene therapy; forensic food supplement; medical imaging; diagnostic; genetic disorder.

This antibody is directed against a human factor VIII inhibitory antibody directed towards the C2 domain of Factor VIII. The anti-idiotypic antibody is characterized by comprising complementarity determining regions (CDRs) given in ADL73176-ADL73181, and by having the capacity to neutralize by at least 50% the inhibition of FVIII procoagulant activity mediated by inhibitory antibodies against the C2 domain of FVIII. The anti-idiotypic antibodies of the invention may be used to treat, prevent or reduce bleeding disorders of haemophilia
                              and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to an isolated nucleic acid derived from Enterococcus faecium polypeptide having one of 10 fully defined sequences given in the (or comprising 40 sequential nucleotides chosen from any of the nucleic acids, its complement or sequences hybridising to it). Also included are a recombinant vector comprising the nucleic acid operably linked to transcription regulatory element, a cell comprising the vector and a recombinant vector comprising the nucleic acid operably linked to transcription regulatory element, a cell comprising the vector and a single-stranded probe comprising the nucleic acid. The nucleic acids is useful for diagnosing pathological conditions. The nucleic acids is useful for diagnosing pathological conditions cesulting from E. faecium bacterial infection (e.g. urinary tract infection) and for screening drugs such as agonists and antagonists. The nucleic acid is useful for recombinant production of Candida albicans on the section and vaccines containing the nucleic acid ace useful for preventing or treating Enterococcus faecium infections. The present sequence represents
                                                                                                                    ö
patients, or to induce apoptosis of B cells carrying anti-C2 inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid derived from Enterococcus faecium encoding e

The encoding cDNA is contained in plasmid designated plo1PA11 deposited with ATCC as Accession No PTA-312. PHOR-1 polypeptides and polymucleotides are useful for diagnosing the presence of cancer, especially prostate, kidney, uterine, cervical, stomach or rectal cancer by determining and comparing the level of the protein or mRNA expression in test and normal tissue samples. Pharmaceutical compositions comprising PHOR-1 is useful for treating cancer. PHOR-1 proteins are useful for identifying ligands and other agents and cellular constituents that binds to PHOR-1 gene product and for generating antibodies which are useful in diagnostic, prognostic and imaging methodologies and for the treatment of prostate cancer. Cell inse expressing PHOR-1 are useful for identifying protein-procein.

(1) have cytostatic, antiarteriosoclerotic, anticonvulsant, nootropic, neuroprotective, carebroprotective, antiallergic, antinilammatory and thyromimetic activities, and can be used in gene therapy. The PMMM polypeptides and polynucleotides are useful in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of PMMM, such as cell proliferative (e.g. cancer, atherosclerosis), neurological (e.g. epilepsy, Huntington's adisease, stroke), immune/inflammatory (e.g. AIDS, allergies) and developmental (e.g. hypothyroidism, Cubhing's syndrome) disorders, or infections. They are also useful in assessing the effects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Hafalia AJA,

of exogenous compounds on the expression of nucleic acid and amino acid sequences of PMMM. The PMMMM or their fragments are useful in screening compounds for effectiveness as agonist or antagonist of the polypeptides, or in altering the expression of the target polymucleotide and compounds that specifically bind to or medulate the activity of the polypeptide. The microarray is useful in monitoring or measuring protein-protein interactions, drug-target interactions, and gene expression profiles

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ઠે
                                                                    Sequence 2, Application US/10224414

Patent No. 6638751

GBNEAL INFORMATION:
HOW MANION:
TITLE OF INVENTION: ISOLATED HUMAN PROTEASE PROTEINS,
TITLE OF INVENTION: USES THEREOF
TITLE OF INVENTION: UNBER: US/10/224,414
CURRENT APPLICATION NUMBER: US/26,903
PRIOR FILING DATE: 2001-08-23
PRIOR FILING DATE: 2001-08-23
PRIOR FILING DATE: 2001-08-23
NUMBER OF SEQ ID NOS: 4
SOSTWARE: FREUSE FREUSE FREUSER OF Windows Version 4.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        APPLICANT: Gary Breton et. al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: PNEUMONIAE FOR DIAGNOSTICS AND THERAPEUTICS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 4515, Application US/09134000C
Patent No. 6617156
GENERAL INFORMATION:
APPLICANT: LYND DOUGETE-Stamm et al
APPLICANT: LYND DOUGETE-Stamm et al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO
TITLE OF INVENTION: ENTEROCOCCCUS FAECALIS FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 032796-032

-!- FUNCTION: Reversible hydration of carbon dioxide.
-!- CATALYTIC ACTIVITY: H(2)CO(3) = CO(2) + H(2)O.
-!- COPACTOR: Zinc (By similarity).
-!- SUBCELLULAR LOCATION: Periplasmic (Potential).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     244 AA

Submitted (JUL-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Putative odcrant receptor.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SUBCELLULAR Belongs to family 1 of G-protein coupled receptors.
-!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
-!- DATABASE: NAME-Human Olfactory Receptor Data Exploratorium (HORDE);

Bacteriol: 185:2330-2337(2003).
-!- FUNCTION: Part of the ABC transporter complex modABC (TC 3.A.1.8)
involved in molybdenum import. Responsible for energy coupling to
the transport system (By similarity).
-!- CATALYTIC ACTIVITY: ATP + H(2)O + molybdate(Out) = ADP + phosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Churcher C., Mungall K.L., Bentley S.D., Thomson N.R., Pickard D., Wain J. -!- SUBUNIT: The complex is composed of two ATP-binding proteins (modC), two transmembrane proteins (modB) and a solute-binding protein (modA) (Probable).
-!- SUBCELLULAR LOCATION: Inner membrane-associated (By similarity).
-!- SIMILARITY: Belongs to the ABC transporter family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SEQUENCE FROM N.A.

Phylogenet. Evol. 22:144-154 (2002).

Mol. Phylogenet. EVOl. 22:144-154 (2002).

-i- FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (complex III or cytochrome b-c1 complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).

-i- COFACTOR: Binds two heme groups non-covalently. Heme 1 (or BL or b562) is low-potential and absorbs at about 562, and heme 2 (or E or b562) is high-potential and absorbs at about 566 (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                InterPro; IPR005798; Cytb b6 C.

-!- SUBUNIT: The main subunits of complex b-c1 are: cytochrome b,
cytochrome c1 and the Rieske protein (By similarity).
-!- SIMILARITY: Belongs to the cytochrome b family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                IRON 1 (HEME B562 AXIAL LIGAND)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chromosoma 103:613-624(1995).

-!- FUNCTION: Required for the differentiation of the dorsal-venting pattern, and does not appear to be involved in the process of segmentation (By similarity).

-!- SUBCELLULAR LOCATION: Nuclear (By similarity).

-!- SIMILARITY: Contains 1 homeobox domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ProDom; PD000010; Homeobox; 1.

-!- SUBUNIT: The main subunits of complex b-cl are: cytochrome b,
cytochrome cl and the Rieske protein (By similarity).
-!- SIMILARITY: Belongs to the cytochrome b family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi, Actinopterygii, Neopterygii, Teleostei, Euteleostei, Neoteleostei

similarity).
SUBUNIT: The main subunits of complex b-cl are: cytochrome b, cytochrome cl and the Rieske protein (By similarity).
SIMILARITY: Belongs to the cytochrome b family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

"Evidence of a cenozoic Betic-Kabilian Connection based on freehwater fish phylogeography (Luciobarbus, Cyprinidae).";

Mol. Phylogenet. Evol. 18:252-263(2001).

-! FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (complex III or cytochrome b-c1 complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).

-! COPACTOR: Binds two heme groups non-covalently. Heme 1 (or BL or. b562) is low-potential and absorbs at about 562, and heme 2 (or BH or b562) is high-potential and absorbs at about 562, and heme 2 (or BH or b566) is high-potential and absorbs at about 566 (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Echinoidea; Euchinoidea; Echinacea; Echinoida; Strongylocentrotidae; Strongylocentrotus.

--- SUBUNT: The main subunits of complex b-c1 are: cytoch cytochrome c1 and the Rieske protein (By similarity).
--- SIMILARITY: Belongs to the cytochrome b family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SEQUENCE FROM N.A.

-!-FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (complex III or expectations), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).

-!-CPACTOR: Binds two heme groups non-covalently. Heme I (or BL or b562) is low-potential and absorbs at about 562, and heme 2 (or or b566) is high-potential and absorbs at about 566 (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    similarity).
SUBUNIT: The main subunits of complex b-cl are: cytochrome b,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mitochondrion.

"Calcineurin-dependent nuclear translocation of a murine transcription
factor NFATx: molecular cloning and functional characterization.";
Mol. Biol. Cell 8:157-170(1997).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Substitute of the matterior components, a pre-existing component of the consists of at least two components, a pre-existing cytoplasmic component NFATC2 and an inducible nuclear component NFATC1. Other members such as NFATC4, NFATC3 or members of the activating protein-1 family, MAF, GATM4 and CDp/9300 can also bind the complex. NFATC proteins bind to DNA as monomers. SUCELILUIAR LOCATION: Cytoplasmic for the phosphorylated form and nuclear after activation that is controlled by calcineurin-mediated dephosphorylation. Rapid nuclear exit of NFATC is thought and transient calcium signals. The subcellular localization of NFATC play a key role in the gene transcription.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SUBUNIT: Member of the multicomponent NFATC transcription complex

                                                                                                               SUBUNIT: Consists of a sigma factor and the RNAP core enzyme which is composed of 2 alpha chains, 1 beta chain, 1 beta' chain and 1 omega chain (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cullings K.W., Morafka D.J., Hernandez J., Roberts J.W.;
Submitted (JUL-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (complex III or cytochrome b-cl complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).
-!- COPACTOR: Binds two heme groups non-covalently. Heme 1 (or BL or b562) is low-potential and absorbs at about 562, and heme 2 (or or b566) is high-potential and absorbs at about 566 (By
terminal regions of the beta' subunit thereby facilitating its interaction with the beta and alpha subunits (By similarity). CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + [RNA](N).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

-!- SUBUNIT: The main subunits of complex b-c1 are: cytochrome b,
cytochrome c1 and the Rieske protein (By similarity).
-!- SIMILARITY: Belongs to the cytochrome b family.
                                                                                                                                                                                         SIMILARITY: Belongs to the RNA polymerase omega chain family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

Acad. Sci., III, Sci. Vie 320:95-101(1997).

FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (complex III or cytochrome b-cl complex), which is a respiratory chain that generates an electrochemical potential coupled to Arp synthesis (By similarity).

COPACTOR: Binds two heme groups non-covalently. Heme 1 (or BL b562) is low-potential and absorbs at about 562, and heme 2 (or b566) is high-potential and absorbs at about 566 (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

COMPLEX (COMPLEX III OR CYTOCHROME B-C1 COMPLEX), WHICH IS A
RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL
COUPLED TO ATP SYNTHESIS (BY SIMILARITY).

-1- COPACTOR: TWO HEME GROUPS (BS62 AND BS66) WHICH ARE NOT COVALENTLY
BOUND TO THE PROTEIN (BY SIMILARITY).

-1- SIBULIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B,
CYTOCHROME C1 AND THE RIESKE PROTEIN (BY SIMILARITY).

-1- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

COMPLEX (COMPLEX III OR CYTOCHROME B-CI COMPLEX), WHICH IS A
COMPLEX (COMPLEX III OR CYTOCHROME B-CI COMPLEX), WHICH IS A
RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL
COUPLED TO ATP SYNTHESIS (BY SIMILARITY).

C -1 COPACTOR: TWO HEME GROUPS (BS62 AND BS66) WHICH ARE NOT COVALENTLY
C -1 SUBUND TO THE PROTEIN (BY SIMILARITY).

C -1 SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B-CI ARE: CYTOCHROME B,
C -1 SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B-CI ARE: CYTOCHROME B,
C -1 SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

C -1 SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

C -2 SIMILARITY: SELONGS TO THE CYTOCHROME B FAMILY.

C -3 SIMILARITY: SICHOCHROME II EA.

C -4 GO:0016021; C:initcchondrial electron transport chain; IEA.

C -5 GO:0016418; P:calectron transport; IEA.

C -6 GO:0016118; P:calectron transport; IEA.

C -7 GO:00160118; P:calectron transport; IEA.

C -7 GO:00160118; P:calectron transport; IEA.

C -7 GO:00160118; P:calectron transport; IEA.

C -7 GO:0018118; P:calectron transport; IEA.
